

Cardano RnR Smart Contact Test Scenario:

This suite of test scenario ensures that the **Cardano Review and Reputation (RnR)** smart contract logic behaves as intended. The goal is to test scenarios for the primary actors (e.g., Business User (Hotel) and End User (reviewers)) while validating that unauthorized actions are prevented.

Test No	User Stories	Conditions	Steps	Expected Output	Accepted Output	Result
1.	Business User (Owner) Submits a Review With Valid Data	Business User has a valid PubKeyHash. Review contains a valid overall Rating between 1 to 5. reviewId: A unique identifier. reviewReferencId: Optional reference ID. timestamp: Current POSIX time. totalScore: Initial total score. ratingCount: Initial rating count. reputationScore: Initial reputation score.	Create a valid Review datum with all required fields. Sign the transaction using the reviewer's private Sign key. Lock it at script address. Unlock with Valid Redeemer. Unlock will happen with valid Pubkeyhash by which it gets Locked.	The validator script passes. Review is accepted. The new reputation score is calculated and checked with the inline datum. Transaction succeeds datum Unlocked with Valid Redeemer.	UTXO with inline datum is successfully created and appears at validator script address Transaction succeeds datum locked.	Pass <input checked="" type="checkbox"/>

```
